                                                                                                                                               Ś
                                                                                                                                                                                                                                         The present invention relates to peptide nucleic acids (PNAs), comprising CC a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammallan cells by hybridising to the RNA component of mammallan cells by hybridising to the RNA component of mammallan cells by hybridising to the RNA component of mammallan cells by hybridising to the RNA component of mammallan telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase cells individuals, such as paternity testing or identification of criminal cells of the telomerase and as information of criminal cells of the telomerase and the horizontal cells of the telomerase cells as the telomerase of the telomerase cells of the telomerase activity. The present sequence representing hTR RNA strand #2 is used to test the inhibition of telomerase activity by the PNAs of the
                                                                                                                                                                       Query Match

```

```
The present sequence is a RNA component of mammalian telomerase, antisense oligonuclectide, which can be used, along with triple helix forming sequences, to inhibit telomerase activity in cells, esp. neoplastic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA component of mammalian telomerase antisense oligonucleotide T3

Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07324-332 and AAZ00332-340 represent constructs with hTR promoter sequence element mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5 regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           specific gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse and human telomerase RNA gene promoters, useful for tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 1999-479183/40

cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other compared to the compared diseases characterized by abnormal telomere metabolism or telomerase activity, in combination with antineoplastic and other cytotoxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect or quantitate polynucleotides having a human telomerase PNA probes are also used for forensic identification of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activity. Telomerase is a ribonucleoprotein enzyme that syntnesizes or strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The invent: relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. therapeutic PNAs may be used for treating disease conditions such as therapeutic PNAs may be used for treating disease conditions, aging, h
                                         possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention relates to an antisense oligonucleotide used as a control sequence alongside a peptide nucleic acid molecule which hybridises the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA

                                                                                                                                                                                                                                                                                                      The present sequence is a PCR primer specific to human telomerase RNA (hTR). It is used to amplify human staufen (hStau) cDNA synthesised using random hexamer primers and Superscript II reverse transcriptase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primer; human telomerase RNA; hTR; amplify; human staufen cDNA; hStau; synthesised; random hexamer primer; Superscript II reverse transcriptase; ss.

                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                   The invention relates to promoter regions from mouse and human CC telomerase RNA (TR) component genes. The TR gene promoter can be linked CC to a heterologous gene, especially a gene enoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation CC respecially neoplasias. The telomerase is necessary for the unrestration of the telomerase repression pathway may cause CC reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription factors, peptide nucleic acids and factors that disrupt CC signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a CC viral thymidine kinase gene can be used to convert a produg, e.g. CC gancyclovir, so that neoplasia can be controlled or treated. Direct CC down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AA207324-332 and AA200332-340 represent constructs with hTR promoter sequence element
                                                                                                                                                                                                                                                                                            Matches

PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component.
                     The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal
                                                                                                                                                                                                                                                                                                                                                                                 New peptide nucleic acids that hybridises to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      lymphoproliferative disease; autoimmune disease; hyperplasia; neurodegenerative disease; neoplasia; HIV; AIDS; cytostatic; human immunodeficiency virus; acquired immunodeficiency syndro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase activity. The present sequence representing a DNA oligonucleotide is complementary to some of the PNAs of the present invention, and is used in melting temperature studies.
                The RNA components of (non) human mammalian telomerase(s) especially from mouse, rat and chinese hamster are all claimed. Antisense oligonucleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerase; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the telomerase gene (also claimed) can be used for study of telomera regulation in vivo, and the role it plays in immortalisation. Two primers (AAT11045, AAT11046) were used to amplify a fragment of the base to the study of telomera regulation.
                                                                                                                                                                                                                                                                                                                                                                                      RNA components of (non)human mammalian telomerase(s) studying cell senescence and immortalisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-JUL-1994;

These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGTG-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07324-332 and AAZ00332-340 represent constructs with hTR promoter sequence element mutations.
This is an oligonucleotide used in the measurement of Tm values and their complimentary peptide nucleic acids (PNAs), (e.g. AAT89225-T89227). PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially in the treatment of
                                                                                                                                                                                                                                                                                              New peptide nucleic acids hybridising to mammalian telomerase used to inhibit telomerase, for treating tumours and other proliferative diseases, also for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09-APR-1997;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA oligonucleotide 2, used in the measurement of Tm values.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            09-APR-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-OCT-1997.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     telomerase RNA (TR) component genes. The TR gene promoter can be linked CC to a heterologous gene, especially a gene encoding a cytotoxin, for CC therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation CC or dysregulation of the telomerase repression pathway may cause CC reactivation or upregulation of telomerase expression in cancer.

CC Substances, identified in the methods, can be used to block transcription CC from the TR gene promoter through interaction of the 5' regulatory CC sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt CC transcription factors, peptide nucleic acids and factors that disrupt CC therapy vectors (especially pGT62-codaup) comprising the promoter and a CC viral thymidiae kinase gene can be used to convert a producy, e.g. CC gancyclovir, so that neoplasia can be controlled or treated. Direct CC down-regulation of telomerase RNA gene through manipulation of treates may be effective antisencer therapy and the cloning cCC transcription factors may be effective antisencer through manipulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (sepecially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAS07324-332 and AAS00332-340 represent constructs with hTR promoter sequence element
           The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               therapy of cancer, especially neoplasias. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleic search, using sw

OTHER INFORMATION: Description of Artificial Sequence:

OTHER INFORMATION: oligonucleotides, linkages between positions 1

OTHER INFORMATION: to 20 are phosphorothicates,

OTHER INFORMATION: linkages between positions 22 to 34 are modified

OTHER INFORMATION: by [N-(-aminoethyl)glycine]methylene carbonyl

OTHER INFORMATION: residdues

OTHER INFORMATION: position 21 n(L) = linker is

OTHER INFORMATION: -O(PO2)-OCH2-CH-(CH2COOH)-(CH2)4-NH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ORGANISM: Artificial Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LENGTH: 34

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleic search, using sw model

Sequence 3, Application PC/TUS9907533

GENERAL INFORMATION:
APPLICANT: THE JOHNS HOPKINS UNIVERSITY SCHOOL OF MEDICINE
TITLE OF INVENTION: TELOWERASE ASSOCIATED PROTEINS
FILE REFERENCE: 07265/157W01
CURRENT APPLICATION UNUMBER: PCT/US99/07533
CURRENT FILING DATE: 1999-04-06
FEARLIER APPLICATION NUMBER: 60/080,783
EARLIER FILING DATE: 1999-04-06
NUMBER OF SEQ ID NOS: 15
SOFTWARE: FASESEQ for Windows Version 3.0
SEQ ID NO 3
LENGTH: 28

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
